

Structural Logging of Drill Core

Course Manual

CONTENTS

- 1 Preface and Acknowledgements
- 2 Oriented holes and oriented core
 - 2.1 Some definitions
 - 2.2 When should core be oriented?
- 3 Structural observations on non-oriented core
 - 3.1 Single holes
 - 3.2 Multiple holes
 - 3.2.1 The three point problem
 - 3.2.2 An elegant solution to determining the attitude of planes
in non-oriented core
- 4 How drill core is oriented
 - 4.1 Non-mechanical means
 - 4.2 Mechanical means
 - 4.2.1 The down-hole spear
 - 4.2.2 The core -stub template tool
- 5 Marking out oriented core
 - 5.1 Checking the orientation mark
 - 5.2 Transferring the orientation mark down the hole
 - 5.3 Cutting oriented core for sampling
- 6 How to recognise structures in core
 - 6.1 Planar structures
 - 6.2 Faults
 - 6.3 Linear structures
 - 6.4 Folds
 - 6.5 The scale problem
 - 6.6 Vergences
- 7 How to measure structure in drill core

7.1 Before measuring

7.2 Measurement conventions

7.3 How many measurements are needed

7.4 Using a core frame

7.5 Using internal core angles

7.5.1 The internal core angles which define planar structure

7.5.2 The internal core angles which define linear structure

7.5.3 How to make internal core measurements

7.5.4 Reducing internal core angles to geographic coordinates

(1) Mathematical reduction

(2) Using a stereonet

7.5.5 Problems with making internal core measurements

7.3 Discussion on the best core measuring technique

8 Recording structural observations

8.1 Types of log form

8.2 Graphical scale logging

8.3 Analytical spreadsheet logging

8.4 Discussion

9 How to plot structural data on drill section

9.1 Discussion

9.2 How to show the attitude of planes on drill section

10 References

APPENDIX 1

How to use a stereonet to convert internal core angles
into standard geographical coordinates
